Service Provider Solutions

Leveraging IMS for Efficient Operations and Multi-media Service Delivery

Reduce the complexity of the IMS Ecosystem

With the advent of the smartphone, the plethora of mobile applications, proliferation of laptop mobile internet cards, and the rise of netbooks and mobility, IP market demands continue to soar, with no end in sight. IMS has emerged as a modern mechanism for providing multi-media services over IP to fixed and mobile networks, and is a standards-based technology choice for ensuring personal mobility.

The complexity of managing the IMS layered architecture (service, control and connectivity layers) is a massive challenge to service providers who must find a way ensure operational efficiencies. Minimizing the number of Operational Support System (OSS) interfaces is key to achieve efficient and differentiated service delivery.

In addition, IMS solutions must provision services both horizontally and vertically to support legacy and IMS environments concurrently.

Redcell is a vendor agnostic, multi-technology platform that provides resource management, configuration, service assurance and provisioning across all of the technologies in the IMS Ecosystem.

Redcell IMS Solution

Dorado Software's Redcell Suite of Resource Management, Service Management, Fulfillment and Assurance products offers Service Providers a true end-to-end solution for their next generation OSS. From service activation, fulfillment and assurance to managing your resources.

The suite is flexible and scalable to meet a wide range of installations, and packaged with tools to easily customize implementations to meet any environments requirements, including any service and support for any device.
